

Olga MASLOVA

Senior/Founding AI Engineer: AI-native, hands-on across BE/FE/DevOps, I build for production

olga.maslova.pro@gmail.com · +41 76 612 34 58 · linkedin.com/in/olgamaslova23 · Fribourg, Switzerland (B Permit, French)

Full-stack engineer with a decade of production software and ML behind me, most recently as CTO of an AI agent startup. I own decisions end to end — architecture, stack, DevOps, the inference bill — as tech lead, as architect. Python, TypeScript, Go, Kubernetes on AWS and Azure; computer vision and NLP from when you trained your own models, and now multi-agent orchestration with persistent memory, sandboxed execution, and guardrails enforced outside the model. Looking for a senior or founding engineering role where AI does real work for customers and I stay hands-on.

SKILLS

AI / Agent Engineering — multi-agent orchestration, agentic memory, guardrails, sandboxed execution, tools, MCP; OpenAI, Claude, Gemini APIs; RAG, evals (LLM-as-judge), observability (Langfuse).

DevOps / Cloud — Docker, Grafana, AWS, Azure, Kubernetes, Fly.io, Cloudflare, CI/CD (Github actions, Gitlab CI)

Backend / Frontend — Python, TypeScript, Angular, VueJS, NodeJS, Kotlin, PostgreSQL, Redis, MongoDB, vector DBs

Data Science / ML — computer vision, NLP, PyTorch, TensorFlow, OpenCV

Document AI — OCR, layout analysis, segmentation, information extraction; invoice and receipt parsing

Languages — French (C2), English (C2), Russian (native)

EXPERIENCE

Co-founder / CTO · Supernaut AI (remote) · 2025 – 2026

Two-engineer team, shared full-stack ownership. Mine: all DevOps and infrastructure, automated deployment, the agent's tool and integration layer (external APIs, MCP), and frontend. Built an autonomous multi-agent platform that takes a business objective and executes it end to end — writing and deploying applications, processing payments, running unattended for weeks.

- **Infrastructure and deployment** — because unattended agents can't wait for a human to press deploy. Owned all DevOps: CI/CD, backend on Fly, frontend on Cloudflare, per-tenant provisioning, monitoring. A user connects an empty repo and that's their only involvement — live on its own domain, no console, deployments triggered by agents rather than supervised by them.
- **Tool and integration layer** — because free-form calls fail in ways agents can't recover from. Agents act only through typed, permissioned tools: MCP servers, external API and payment integrations, schema validation at the boundary, failures returned as results the planner can route around instead of exceptions that kill the run.
- **Multi-agent orchestration** — because no single context window holds a month-long goal. Planner, executor and verifier as separate agents over a durable shared ledger — no agent grades its own homework.
- **Agentic memory** — because self-curated memory drifts. Written automatically, retrieved by relevance — never recency — with permissions rechecked on every recall.
- **AI guardrails** — because unattended autonomy needs hard limits. Capability granted by construction, not instruction — enforced outside the model, ended by a kill switch.
- **Inference economics** — because hundred-step agents cost quadratically if you're naive. Cache-aware context management, loop-breaking before execution: cut inference cost by 60%.

Senior Full-Stack Software Engineer · Thesify SA/HeyScience SA, Lausanne, Switzerland · 2023 – 2025

Led backend and frontend development of data-centric full-stack software solutions, including API structuring and UI implementation. Oversaw hands-on DevOps processes, including Kubernetes cluster management, service orchestration and monitoring. Collaborated closely with cross-functional teams to guide project planning and execution, while serving as technical lead.

Tech Lead · Smarter Data Labs, France · 2020 – 2023

Developed a web platform using Angular with a serverless architecture on AWS, designing high-level architecture and technical specifications for the product. Led team management efforts, including hiring, mentoring, and guiding engineers to ensure project success. Conducted machine learning research with the project receiving a deep tech grant for innovation.

Research Fellow · Université Savoie Mont Blanc, France · 2020

Developed advanced deep learning solutions for industrial applications, focusing on computer vision for image segmentation of 360-degree images. Conducted research and implemented models tailored to industry needs.

Data Scientist / Software Engineer · AboutGoods Company, France · 2017 – 2020

Receipt understanding end to end. OpenCV pipelines to locate and rectify receipts in photos taken in the wild — skew, creases, shadows, faded thermal print — then segmentation and NLP to extract merchant, date, totals, taxes and individual line items. Trained the models and built the back-end API microservices serving inference in production, in Python, Kotlin and Go. Pre-LLM, so there was no foundation model to fall back on: accuracy came from the data pipeline, targeted labeling and error analysis on the failure cases.

Research Associate · Freelance, France · 2013 – 2017

Research and modeling of semiconductor materials (MATLAB)

PhD Fellow in Physics · Laboratoire de génie électrique de Paris, France · 2009 – 2013

Computer modeling of physical phenomena, electrical and optical characterization of solar cells.

EDUCATION

Bachelor of Science in Computer Science (with honors), 2018 - Université Savoie Mont Blanc, France

PhD in Physics (with honors), 2013 - Université Paris-Sud 11 (now Paris-Saclay), France

Master of Science in Chemistry (with honors), 2009 - Lomonosov Moscow State University, Russia
